Attraverso i servizi connectionless, i pacchetti sono inoltrati nella reta individualmente e indirizzati indipendentemente. Non é richiesto nessun setup iniziale. I pad

Store-and-Forward Packet Switching

Hosts send packets into the network; packets are forwarded by routers

Un host inoltra i pacchetti al router piú vicino (della LAN o del ISP), il quale mantiene nel buffer ció che ha ricevuto fin quando l'host non ha finito di inotrare tutti i pacchetti. Sol

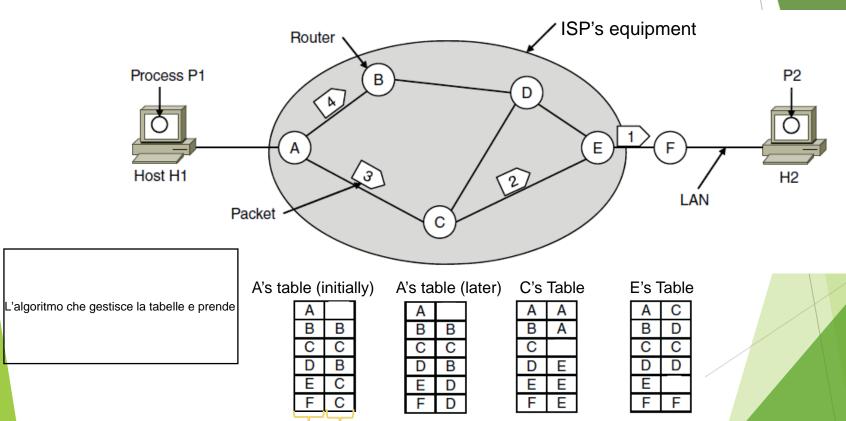

Connectionless Service - Datagrams

Il sistema operativo assegna un header al frame e lo invia alla rete. A questo pu

- Packet is forwarded using destination address inside it
 - Different packets may take different paths

Comparison of Virtual-Circuits &

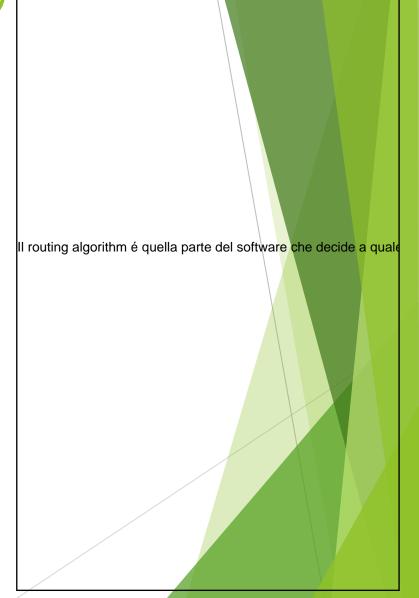

Datagrams La principare differenza é che attraverso il virtual circuit si garantisce una certa qualità del servizio e si evitano le congestioni più f

Issue	Datagram network	Virtual-circuit network
Circuit setup	Not needed	Required
Addressing	Each packet contains the full source and destination address	Each packet contains a short VC number
State information	Routers do not hold state information about connections	Each VC requires router table space per connection
Routing	Each packet is routed independently	Route chosen when VC is set up; all packets follow it
Effect of router failures	None, except for packets lost during the crash	All VCs that passed through the failed router are terminated
Quality of service	Difficult	Easy if enough resources can be allocated in advance for each VC
Congestion control	Difficult	Easy if enough resources can be allocated in advance for each VC

Routing Algorithms (2)

- Routing is the process of discovering network paths
 - Model the network as a graph of nodes and links
 - Decide what to <u>optimize</u> (e.g., fairness vs efficiency)
 - Update routes for changes in topology (e.g., failures)

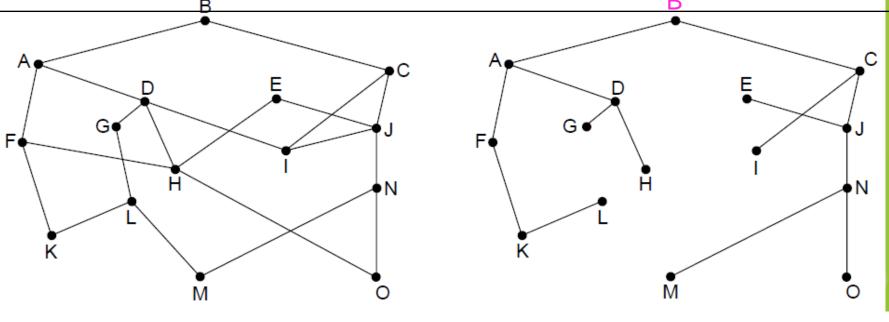

Pricipio di ottimalitá: se J é un nodo tra la via ottima che va da I a K, allora é un percorso ottimo anche tra J e K, e J e I.Questo principio serve come riferir

The Optimality Principle

Each portion of a best path is also a best path; the union of them to a router is a tree called the sink tree

Best means fewest hops in the example

Dato che il sink tree é un albero, anch'esso non avrá cicli, il che assicura che il pacchetto arrivi a destinazione entro un numero finito di salti. Nel mondo reale, p

Network

Sink tree of best paths to router B

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Shortest Path Algorithm (1)

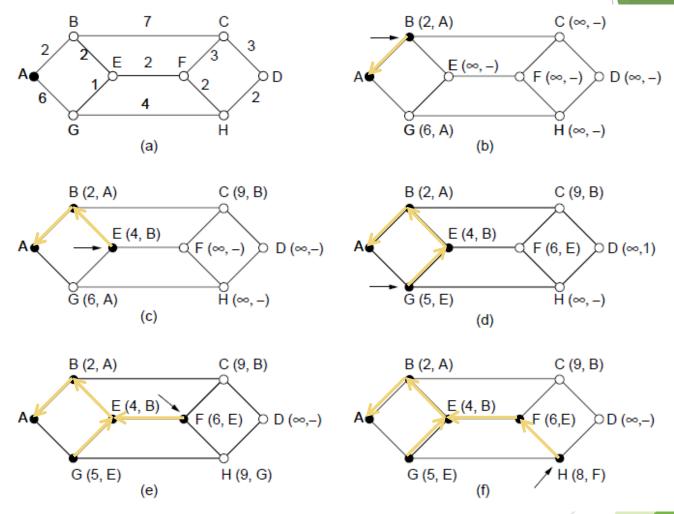

Dijkstra's algorithm computes a sink tree on the graph:

- Each link is assigned a non-negative weight/distance
- Shortest path is the one with lowest total weight
- Using weights of 1 gives paths with fewest hops

Algorithm:

- Start with sink, set distance at other nodes to infinity
- Relax distance to other nodes
- Pick the lowest distance node, add it to sink tree
- Repeat until all nodes are in the sink tree

Shortest Path Algorithm (2)

A network and first five steps in computing the shortest wether after a from A to D. Pink arrows show the sink tree so far.

Shortest Path Algorithm (3)

. . .

```
for (p = &state[0]; p < &state[n]; p++) {
    p->predecessor = -1:
    p->length = INFINITY;
    p->label = tentative;
state[t].length = 0; state[t].label = permanent;
k = t;
do {
    for (i = 0; i < n; i++)
         if (dist[k][i] != 0 && state[i].label == tentative) {
               if (state[k].length + dist[k][i] < state[i].length) {
                    state[i].predecessor = k;
                    state[i].length = state[k].length + dist[k][i];
```

Start with the sink, all other nodes are unreachable

Relaxation step.
Lower distance to nodes linked to newest member of the sink tree

Shortest Path Algorithm (4)

```
k = 0; min = INFINITY;
for (i = 0; i < n; i++)
    if (state[i].label == tentative && state[i].length < min) {
        min = state[i].length;
        k = i;
    }
state[k].label = permanent;
} while (k != s);</pre>
```

Find the lowest distance, add it to the sink tree, and repeat until done

Flooding

A simple method to send a packet to all network nodes

Each node floods a new packet received on an incoming link by sending it out all of the other links

Nodes need to keep track of flooded packets to stop the flood; even using a hop limit can blow up exponentially

Per evitare che pacchetti, con informazioni datate sulla topologia, continuino a vagare per la rete all'infinito, si aggiunge un contatore (inizializzato alla distanza tra mitt

Distance Vector Routing (1)

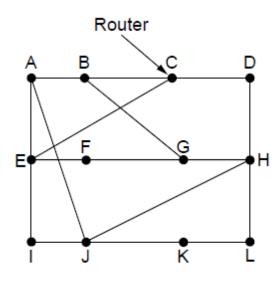

<u>Distance vector</u> is a distributed routing algorithm

Shortest path computation is split across nodes

Algorithm:

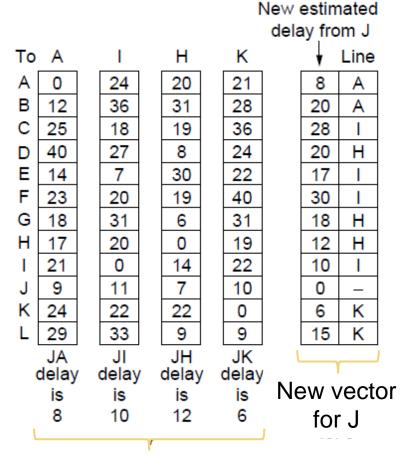

- ► Each node knows distance of links to its neighbors
- Each node advertises vector of lowest known distances to all neighbors
- Each node uses received vectors to update its own
- Repeat periodically

Distance Vector Routing (2)

Network

Ogni router mantiene una copia della routing table contenente ogni nodo della re

Vectors received at J from Neighbors A, I, H and K

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

The Count-to-Infinity Problem

Failures can cause DV to "count to infinity" while seeking a path to an unreachable node

Bad news of no path to *A* is learned slowly

Link State Routing (1)

<u>Link state</u> is an alternative to distance vector

- More computation but simpler dynamics
- Widely used in the Internet (OSPF, ISIS)

Algorithm:

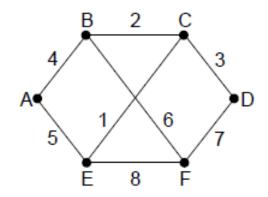

- Each node floods information about its neighbors in LSPs (Link State Packets); all nodes learn the full network graph
- Each node runs Dijkstra's algorithm to compute the path to take for each destination

É composto da 5 step:1) scoprire i nodi vicini e sapere i loro indirizzi;2) stabilire la distanza o la metrica del costo;3) costruire il pacchetto con tutto quello che si sa;4) inv

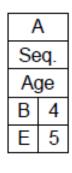

Link State Routing (2) - LSPs

LSP (Link State Packet) for a node lists neighbors and weights of links to reach them

Per il passaggio 3, il pacchetto inizia con l'identificatore del router che lo sta costruendo, seguito dal sequence number e dal timestamp.Rimane ora da decidere quando

Hierarchical Routing

Per ridurre il numero di voci e di calcolo della topologia si puó dividere la rete in reg

Hierarchical routing reduces the work of route computation but may result in slightly longer paths than flat routing

Multicast Routing (2) - Sparse Case

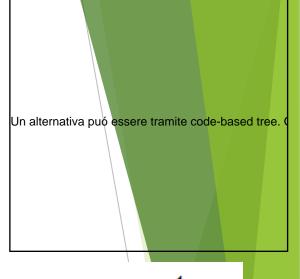

- CBT (Core-Based Tree) uses a single tree to multicast
 - Tree is the sink tree from core node to group members
 - Multicast heads to the core until it reaches the CBT

p 1.

Sink tree from core to group 1

Multicast is send to the core then down when it reaches the sink tree

Sender

Sender

Core

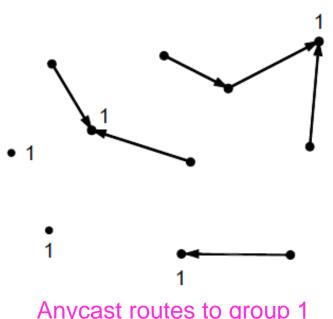

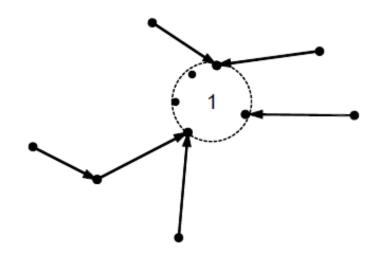

Anycast Routing

Anycast sends a packet to one (nearest) group member

► Falls out of regular routing with a node in many places

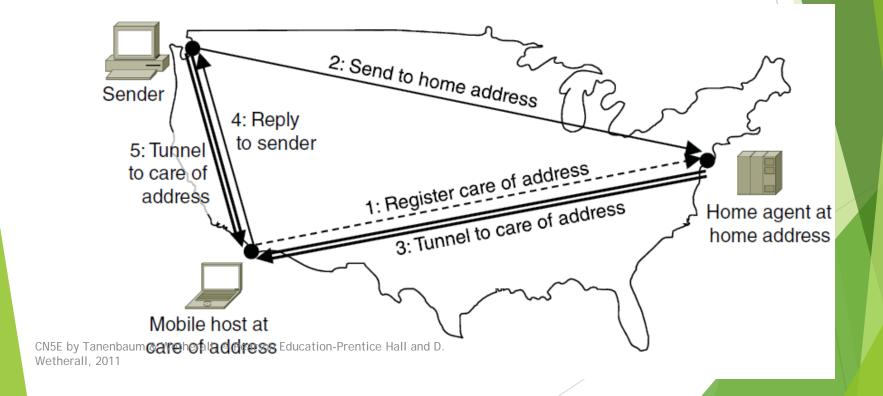

Apparent topology of sink tree to "node" 1

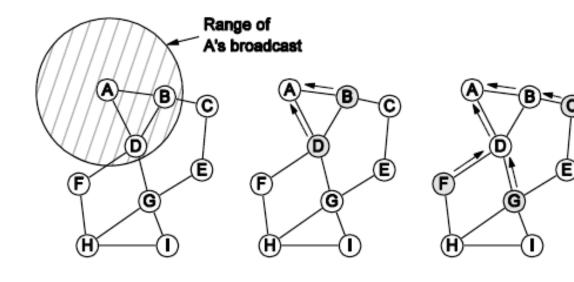

Routing for Mobile Hosts

- Mobile hosts can be reached via a home agent
 - Fixed home agent tunnels packets to reach the mobile host; reply can optimize path for subsequent packets
 - No changes to routers or fixed hosts

Routing in Ad Hoc Networks

- The network topology changes as wireless nodes move
 - Routes are often made on demand, e.g., AODV (below)

find route to /

A's starts to A's broadcast reaches B & D B's and D's broadcast reach C, F & G

C's, Fs and G's broadcast reach H & I

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Congestion Control (1)

Handling congestion is the responsibility of the Network and Transport layers working together

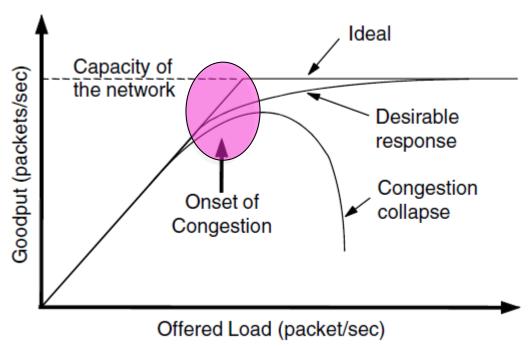

- ▶ We look at the Network portion here
- Traffic-aware routing »
- Admission control »
- Traffic throttling »
- Load shedding »

Congestion Control (2)

Congestion results when too much traffic is offered; performance degrades due to loss/retransmissions

Goodput (=useful packets) trails offered load

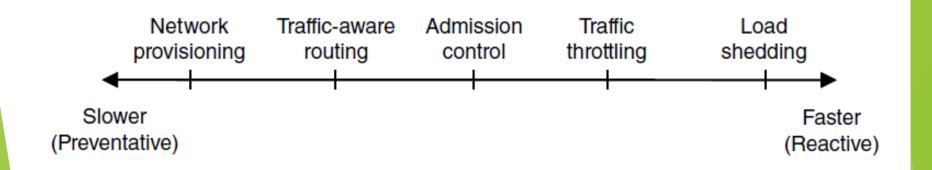

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Congestion Control (3) - Approaches

Network must do its best with the offered load

- Different approaches at different timescales
- Nodes should also reduce offered load (Transport)

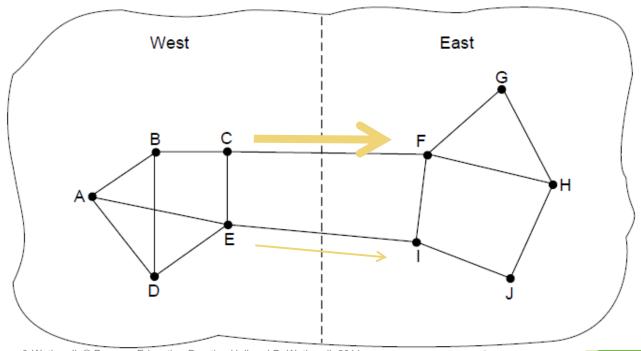

Traffic-Aware Routing

Choose routes depending on traffic, not just topology

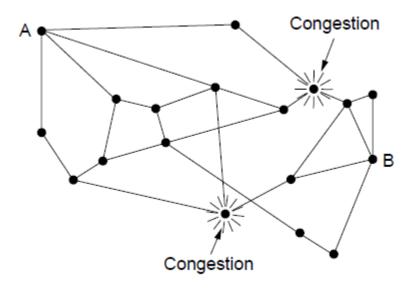

- ▶ E.g., use *EI* for West-to-East traffic if *CF* is loaded
- But take care to avoid oscillations

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Admission Control

- Admission control allows a new traffic load only if the network has sufficient capacity, e.g., with virtual circuits
 - Can combine with looking for an uncongested route

Wetherall, 2011

Network with some

congested nodes

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D.

A Virtual circuit

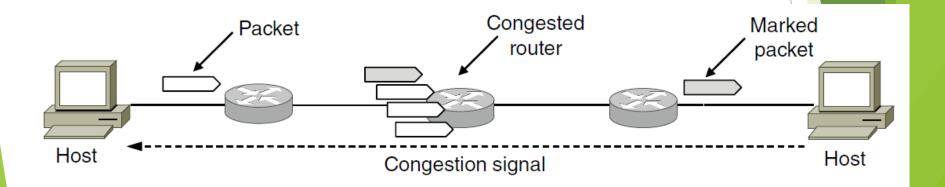

Uncongested portion and route *AB* around congestion

Traffic Throttling

Congested routers signal hosts to slow down traffic

► ECN (Explicit Congestion Notification) marks packets and receiver returns signal to sender

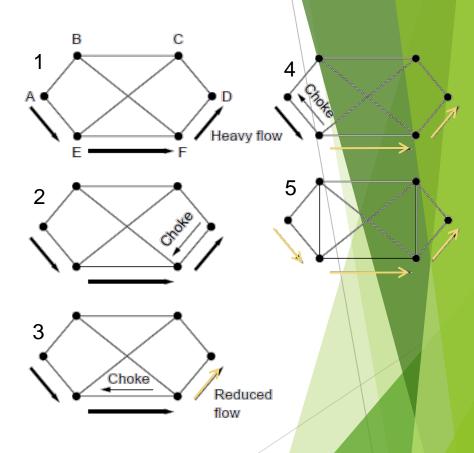

Load Shedding (1)

When all else fails, network will drop packets (shed load)

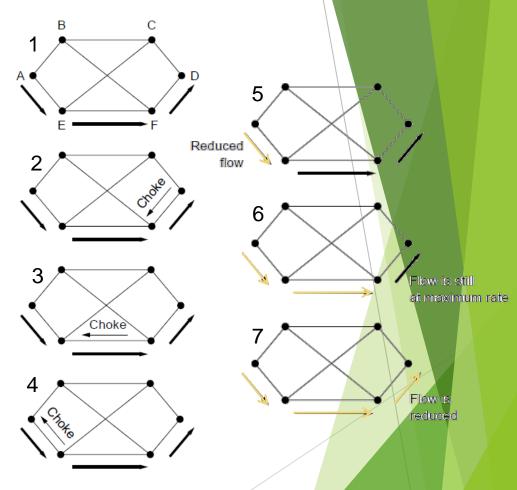

Can be done end-to-end or link-bylink

Link-by-link (right) produces rapid relief

Load Shedding (2)

End-to-end (right) takes longer to have an effect, but can better target the cause of congestion

Quality of Service

- Application requirements »
- Traffic shaping »
- Packet scheduling »
- Admission control »
- Integrated services »
- Differentiated services »

Application Requirements (1)

Different applications care about different properties

We want all applications to get what they need

Application	Bandwidth	Delay	Jitter	Loss
Email	Low	Low	Low	Medium
File sharing	High	Low	Low	Medium
Web access	Medium	Medium	Low	Medium
Remote login	Low	Medium	Medium	Medium
Audio on demand	Low	Low	High	Low
Video on demand	High	Low	High	Low
Telephony	Low	High	High	Low
Videoconferencing	High	High	High	Low

"High" means a demanding requirement, e.g., low delay

Application Requirements (2)

Network provides service with different kinds of QoS (Quality of Service) to meet application requirements

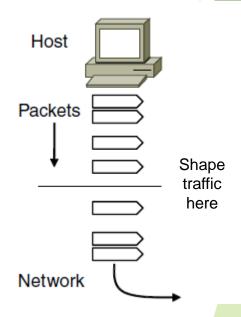

Network Service	Application
Constant bit rate	Telephony
Real-time variable bit rate	Videoconferencing
Non-real-time variable bit rate	Streaming a movie
Available bit rate	File transfer

Example of QoS categories from ATM networks

Traffic Shaping (1)

Traffic shaping regulates the average rate and burstiness of data entering the network

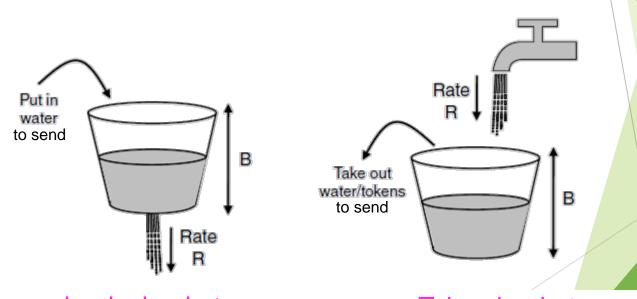

Lets us make guarantees

Traffic Shaping (2)

Token/Leaky bucket limits both the average rate (R) and short-term burst (B) of traffic

For token, bucket size is B, water enters at rate R and is removed to send; opposite for leaky.

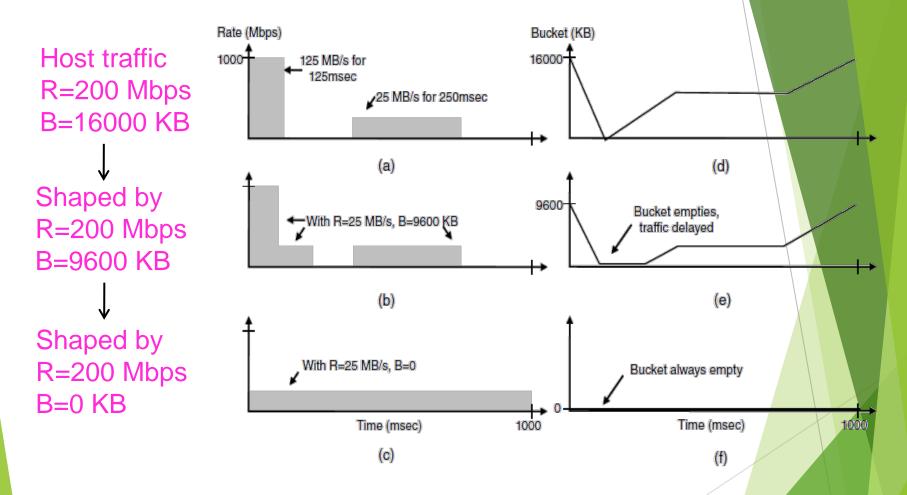

Leaky bucket Token bucket

CNSE by Tanenbaum & Wenderland of the Fried Send (need some water to send)

Traffic Shaping (3)

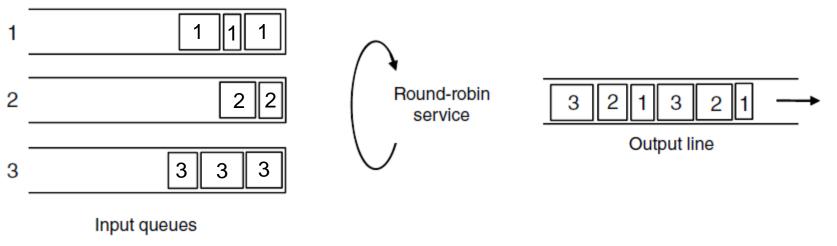

Smaller bucket size delays traffic and reduces burstiness

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Packet Scheduling (1)

Packet scheduling divides router/link resources among traffic flows with alternatives to FIFO (First In First Out)

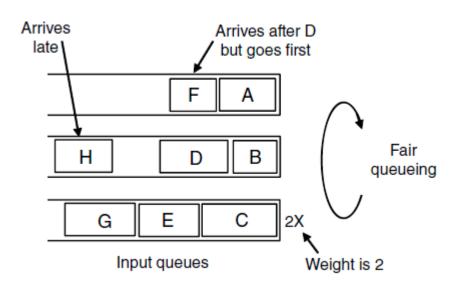

Example of round-robin queuing

Packet Scheduling (2)

Fair Queueing approximates bit-level fairness with different packet sizes; weights change target levels

Result is WFQ (Weighted Fair Queueing)

Packets may be sent out of arrival order

Packet		Length		Output
	time		time	order
Α	0	8	8	1
В	5	6	11	3
С	5	10	10	2
D	8	9	20	7
Е	8	8	14	4
F	10	6	16	5
G	11	10	19	6
Н	20	8	28	8

$$F_i = max(A_i, F_{i-1}) + L_i/W$$

Finish virtual times determine transmission order

Admission Control (1)

Admission control takes a traffic flow specification and decides whether the network can carry it

Sets up packet scheduling to meet QoS

Parameter	Unit
Token bucket rate	Bytes/sec
Token bucket size	Bytes
Peak data rate	Bytes/sec
Minimum packet size	Bytes
Maximum packet size	Bytes

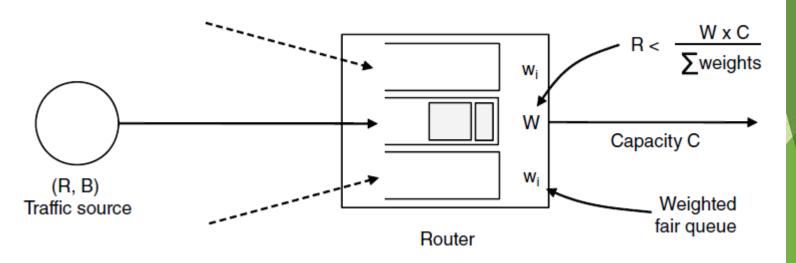

Example flow specification

Admission Control (2)

Construction to guarantee bandwidth B and delay D:

- ▶ Shape traffic source to a (R, B) token bucket
- Run WFQ with weight W / all weights > R/capacity
- ► Holds for all traffic patterns, all topologies

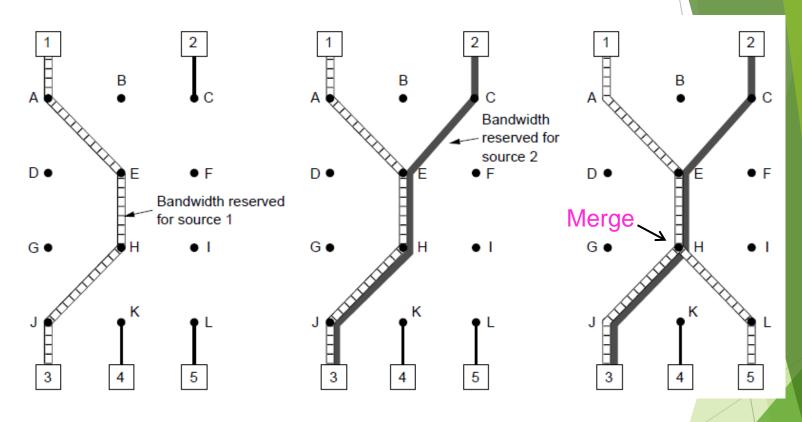

Integrated Services (1)

Design with QoS for each flow; handles multicast traffic.

Admission with RSVP (Resource reSerVation Protocol):

- Receiver sends a request back to the sender
- ► Each router along the way reserves resources
- Routers merge multiple requests for same flow
- ▶ Entire path is set up, or reservation not made

Integrated Services (2)

R3 reserves flow from S1

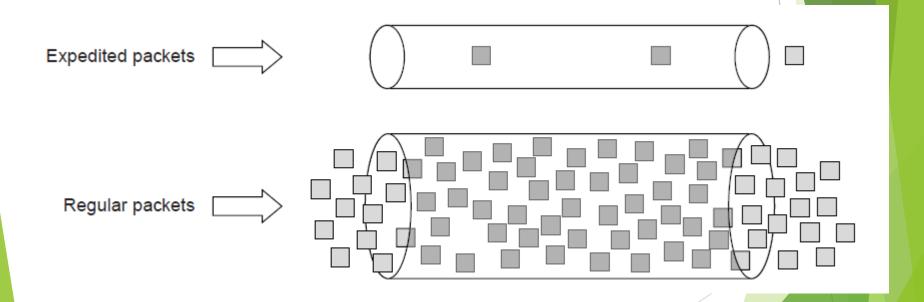

R3 reserves flow from S2

R5 reserves flow from S1 merged with R3 at H

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Differentiated Services (1)

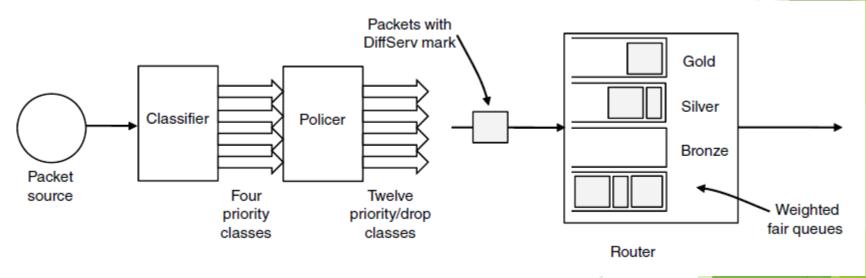

- Design with classes of QoS; customers buy what they want
 - Expedited class is sent in preference to regular class
 - Less expedited traffic but better quality for applications

Differentiated Services (2)

Implementation of DiffServ:

- Customers mark desired class on packet
- ▶ ISP shapes traffic to ensure markings are paid for
- Routers use WFQ to give different service levels

Internetworking

Internetworking joins multiple, different networks into a single larger network

- How networks differ »
- How networks can be connected »
- Tunneling »
- Internetwork routing »
- Packet fragmentation »

How Networks Differ

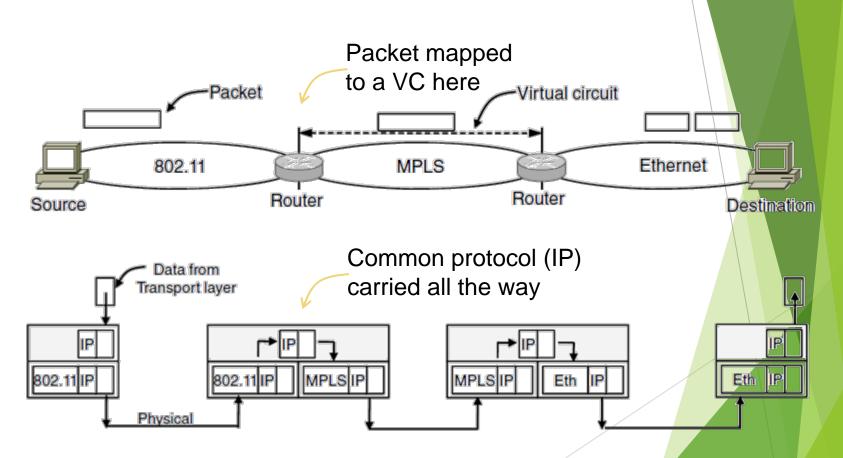

Differences can be large; complicates internetworking

Item	Some Possibilities
Service offered	Connectionless versus connection oriented
Addressing	Different sizes, flat or hierarchical
Broadcasting	Present or absent (also multicast)
Packet size	Every network has its own maximum
Ordering	Ordered and unordered delivery
Quality of service	Present or absent; many different kinds
Reliability	Different levels of loss
Security	Privacy rules, encryption, etc.
Parameters	Different timeouts, flow specifications, etc.
Accounting	By connect time, packet, byte, or not at all

How Networks Can Be

Coternetworking Gased on a common network layer - IP

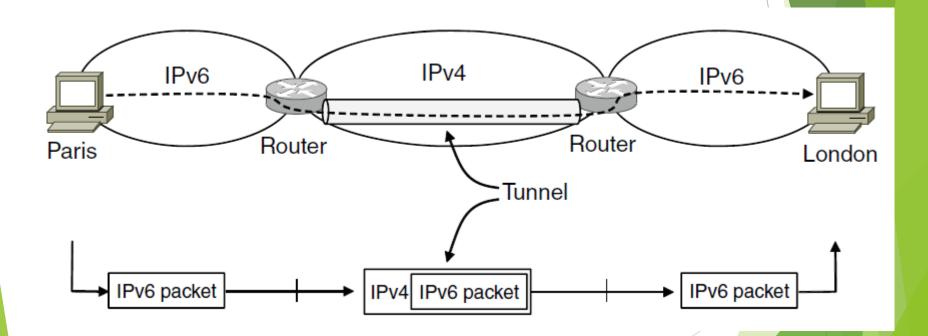

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

Tunneling (1)

Connects two networks through a middle one

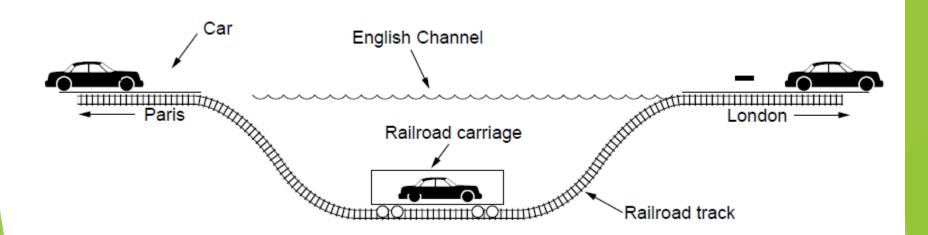

Packets are encapsulates over the middle

Tunneling (2)

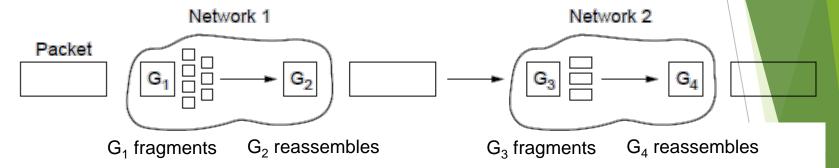

Tunneling analogy:

tunnel is a link; packet can only enter/exit at ends

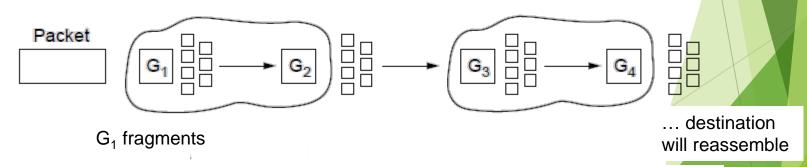

Packet Fragmentation (1)

- Networks have different packet size limits for many reasons
 - Large packets sent with fragmentation & reassembly

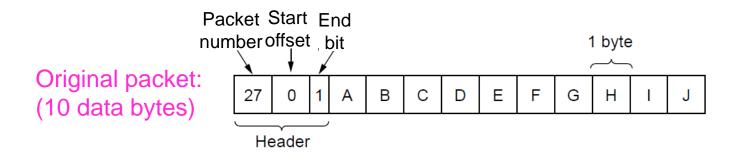

Transparent – packets fragmented / reassembled in each network

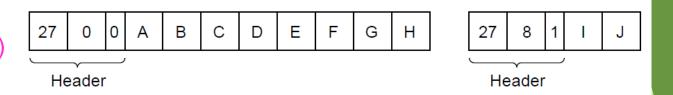

CN5E by Tanenbau Nontherans parentation Pragments are reassembled at destination
Wetherall, 2011

Packet Fragmentation (2)

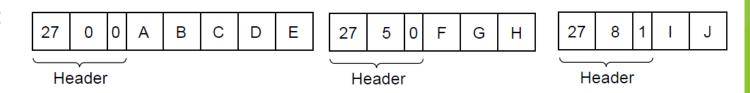

Example of IP-style fragmentation:

Fragmented: (to 8 data bytes)

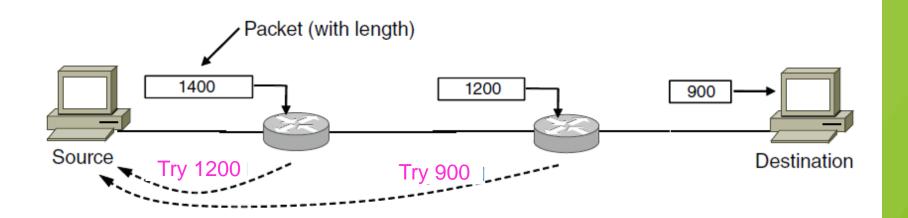

Re-fragmented: (to 5 bytes)

Packet Fragmentation (3)

Path MTU Discovery avoids network fragmentation

Routers return MTU (Max. Transmission Unit) to source and discard large packets

Network Layer in the Internet (1)

- ▶ IP Version 4 »
- IP Addresses »
- ▶ IP Version 6 »
- Internet Control Protocols »
- Label Switching and MPLS »
- OSPF—An Interior Gateway Routing Protocol »
- BGP—The Exterior Gateway Routing Protocol »
- Internet Multicasting »
- ► Mobile IP »

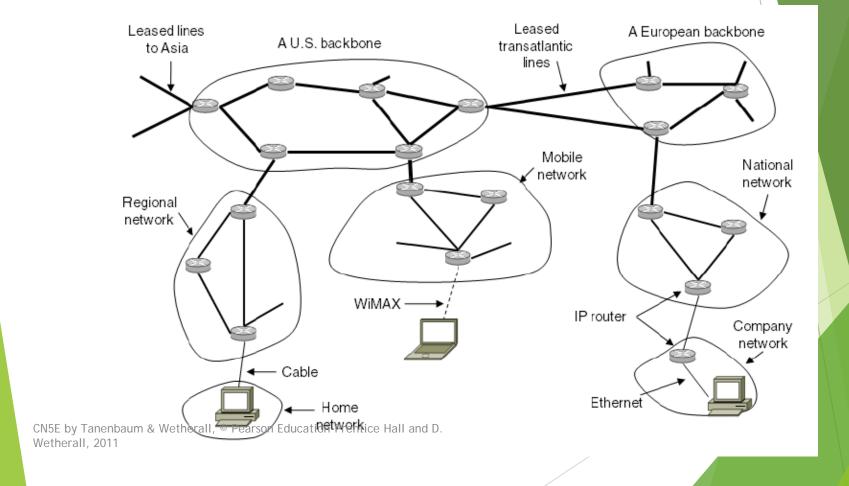

Network Layer in the Internet

IP has been shaped by guiding principles:

- ▶ Make sure it works
- ▶ Keep it simple
- Make clear choices
- Exploit modularity
- Expect heterogeneity
- Avoid static options and parameters
- Look for good design (not perfect)
- Strict sending, tolerant receiving
- Think about scalability
- Consider performance and cost

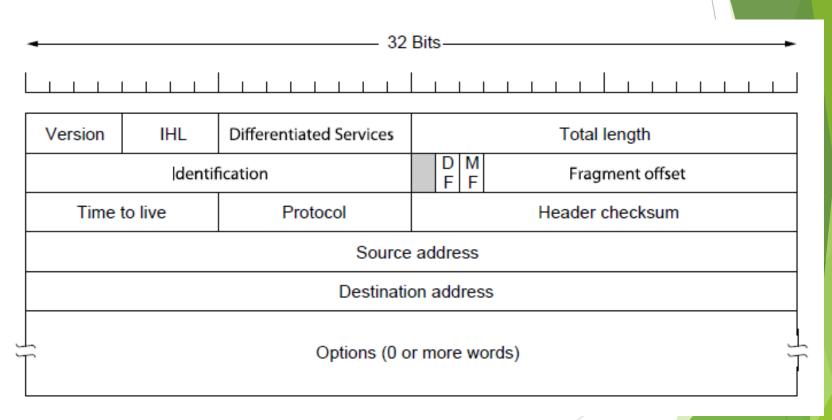

Network Layer in the Internet (3)

Internet is an interconnected collection of many networks that is held together by the IP protocol

IP Version 4 Protocol (1)

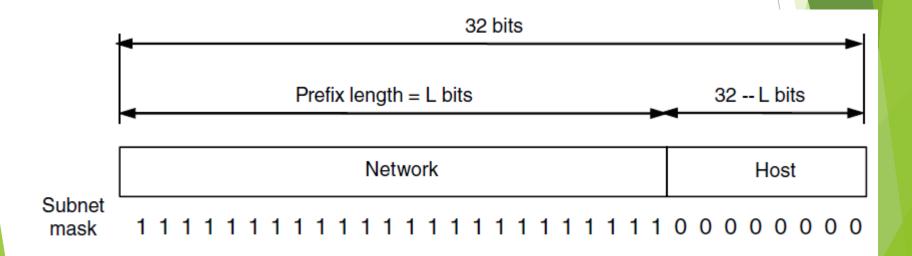

IPv4 (Internet Protocol) header is carried on all packets and has fields for the key parts of the protocol:

IP Addresses (1) - Prefixes

Addresses are allocated in blocks called <u>prefixes</u>

- Prefix is determined by the network portion
- ► Has 2^L addresses aligned on 2^L boundary
- Written address/length, e.g., 18.0.31.0/24

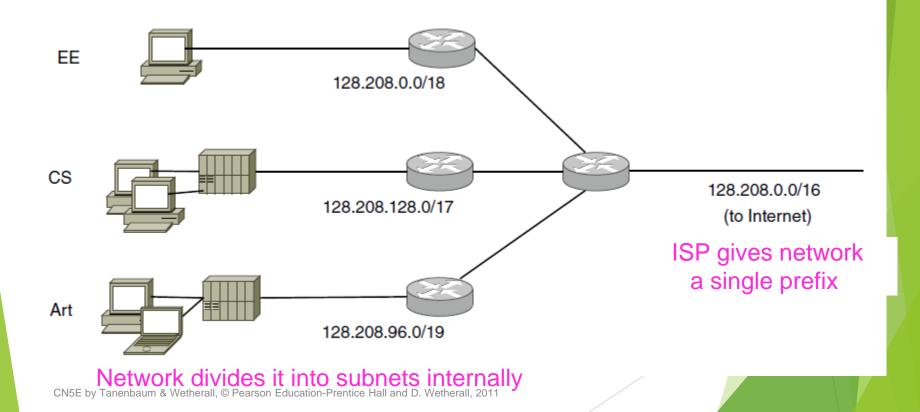

IP Addresses (2) - Subnets

Subnetting splits up IP prefix to help with management

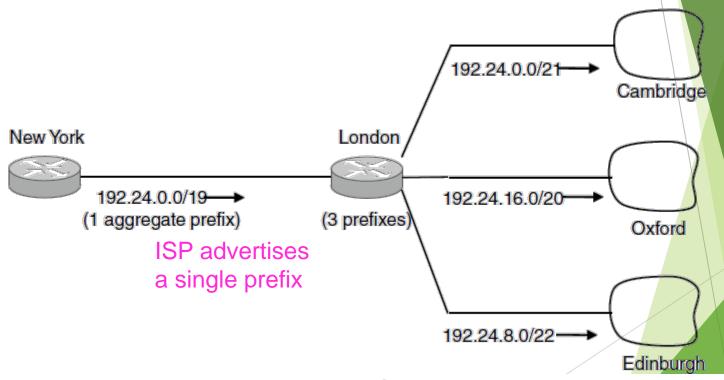

Looks like a single prefix outside the network

IP Addresses (3) - Aggregation

Aggregation joins multiple IP prefixes into a single larger prefix to reduce routing table size

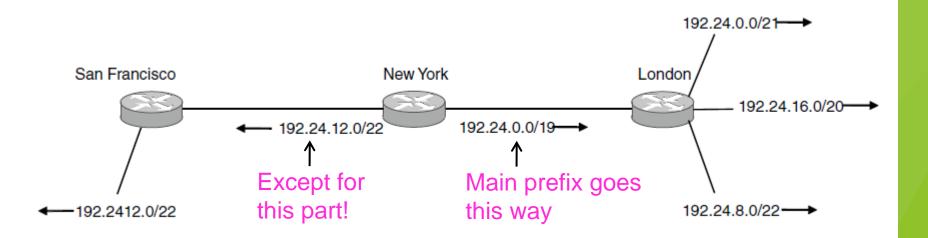

ISP customers have different prefixes

IP Addresses (4) - Longest Matching Prefix

Packets are forwarded to the entry with the <u>longest matching prefix</u> or smallest address block

Complicates forwarding but adds flexibility

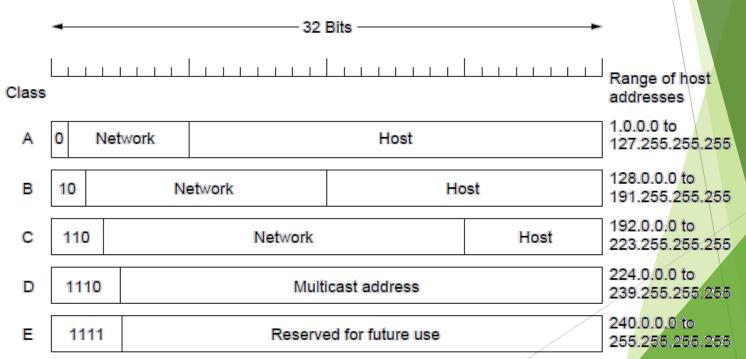

IP Addresses (5) - Classful

A O Cade Ses Came in blocks of fixed size (A, B, C)

- Carries size as part of address, but lacks flexibility
- Called classful (vs. classless) addressing

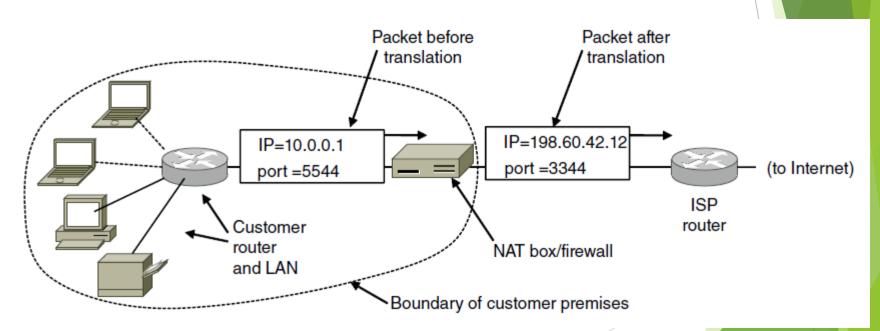

CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

IP Addresses (6) - NAT

NAT (Network Address Translation) box maps one external IP address to many internal IP addresses

- Uses TCP/UDP port to tell connections apart
- Violates layering; very common in homes, etc.

IP Version 6 (1)

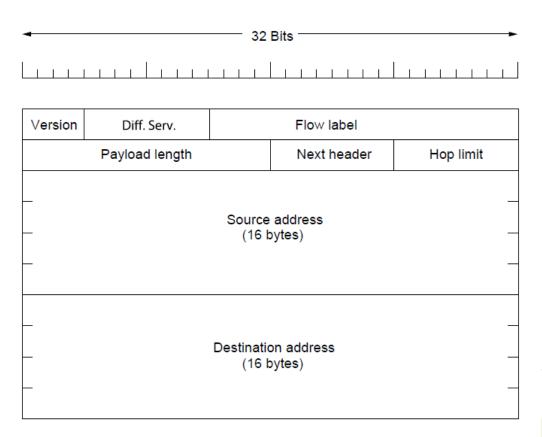

Major upgrade in the 1990s due to impending address exhaustion, with various other goals:

- Support billions of hosts
- ▶ Reduce routing table size
- Simplify protocol
- Better security
- Attention to type of service
- Aid multicasting
- Roaming host without changing address
- Allow future protocol evolution
- ▶ Permit coexistence of old, new protocols, ...

Deployment has been slow & painful, but may pick up pace now that addresses are all but exhausted

IP Version 6 (2)

IPv6 protocol header has much longer addresses (128 vs. 32 bits) and is simpler (by using extension headers)

IP Version 6 (3)

IPv6 extension headers handles other functionality

Extension header	Description
Hop-by-hop options	Miscellaneous information for routers
Destination options	Additional information for the destination
Routing	Loose list of routers to visit
Fragmentation	Management of datagram fragments
Authentication	Verification of the sender's identity
Encrypted security payload	Information about the encrypted contents

Internet Control Protocols (1)

IP works with the help of several control protocols:

- ► ICMP is a companion to IP that returns error info
 - ▶ Required, and used in many ways, e.g., for traceroute
- ▶ ARP finds Ethernet address of a local IP address
 - ▶ Glue that is needed to send any IP packets
 - ▶ Host queries an address and the owner replies
- ▶ DHCP assigns a local IP address to a host
 - ▶ Gets host started by automatically configuring it
 - Host sends request to server, which grants a lease

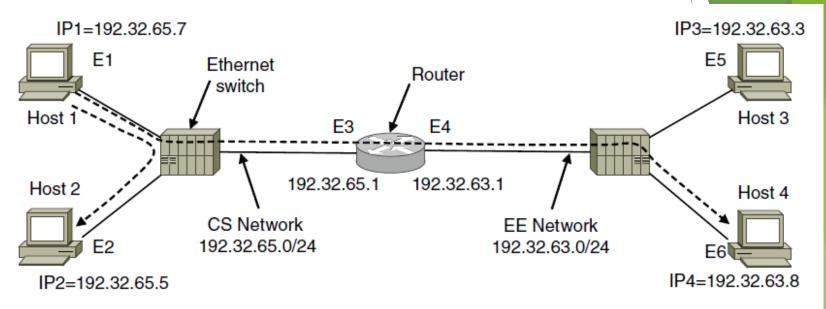

Internet Control Protocols (2)

Main ICMP (Internet Control Message Protocol) types:

Message type	Description
Destination unreachable	Packet could not be delivered
Time exceeded	Time to live field hit 0
Parameter problem	Invalid header field
Source quench	Choke packet
Redirect	Teach a router about geography
Echo and Echo reply	Check if a machine is alive
Timestamp request/reply	Same as Echo, but with timestamp
Router advertisement/solicitation	Find a nearby router

Internet Control Protocols (3)

ARP (Address Resolution Protocol) lets nodes find target Ethernet addresses [pink] from their IP addresses

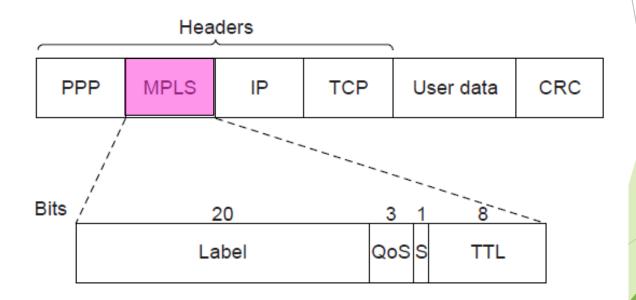

Frame	Source IP	Source Eth.	Destination IP	Destination Eth.
Host 1 to 2, on CS net	IP1	E1	IP2	E2
Host 1 to 4, on CS net	IP1	E1	IP4	E3
rHlostPfatton4,dontiEPrneit	e Hall an d D.	E4	IP4	E6

CN5E by Tanenbaum & Wether Wetherall, 2011

Label Switching and MPLS (1)

MPLS (Multi-Protocol Label Switching) sends packets along established paths; ISPs can use for QoS

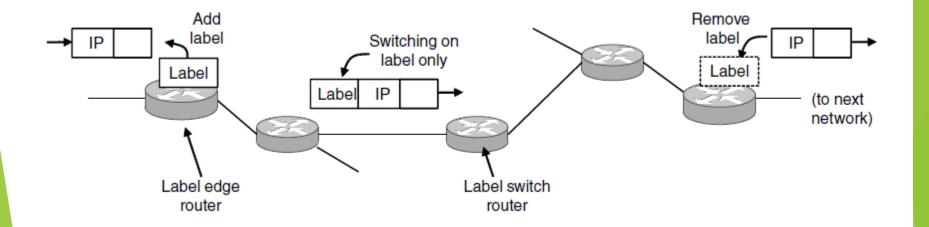

Path indicated with label below the IP layer

Label Switching and MPLS (2)

Label added based on IP address on entering an MPLS network (e.g., ISP) and removed when leaving it

Forwarding only uses label inside MPLS network

OSPF— Interior Routing

OSPF computes routes for a single network (e.g., ISP)

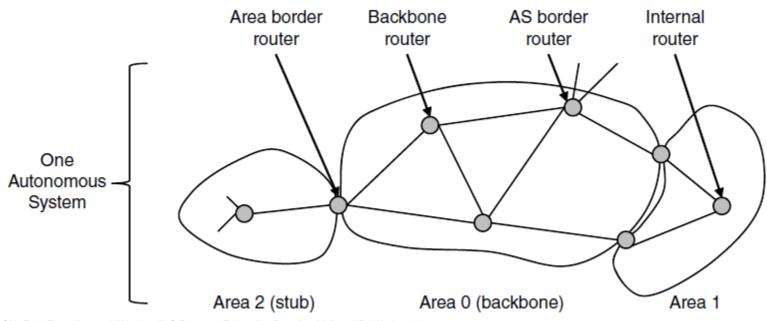

Models network as a graph of weighted edges

R3 R1R5 Network: LAN 4 LAN₃ LAN 2 R4 R2 5 LAN 4 LAN₁ R1R3 R5 3 Graph: 5 5 LAN3 **Broadcast LAN** modeled as a well-R4 connected node LAN 2 R2
CN5E by Tanenbaum & Wetherall, © Pearson Education-Prentice Hall and D. Wetherall, 2011

OSPF— Interior Routing Protoco (2) OSPF divides one large network (Autonomous System) into areas

connected to a backbone area

Helps to scale; summaries go over area borders

CN5E by Tanenbaum & Wetherall, @ Pearson Education-Prentice Hall and D. Wetherall, 2011

OSPF— Interior Routing Protocol (3)
OSPF (Open Shortest Path First) is link-state routing:

- Uses messages below to reliably flood topology
- Then runs Dijkstra to compute routes

Message type	Description
Hello	Used to discover who the neighbors are
Link state update	Provides the sender's costs to its neighbors
Link state ack	Acknowledges link state update
Database description	Announces which updates the sender has
Link state request	Requests information from the partner

BGP— Exterior Routing Protocol (1)

BGP (Border Gateway Protocol) computes routes across interconnected, autonomous networks

Key role is to respect networks' policy constraints

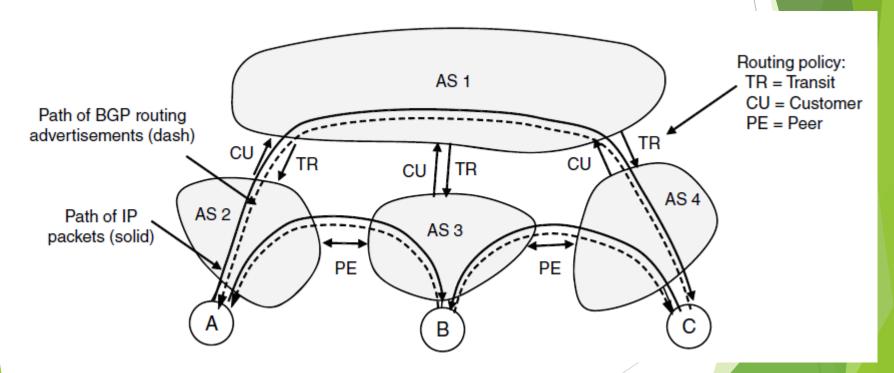

Example policy constraints:

- ▶ No commercial traffic for educational network
- Never put Iraq on route starting at Pentagon
- Choose cheaper network
- ▶ Choose better performing network
- Don't go from Apple to Google to Apple

BGP— Exterior Routing

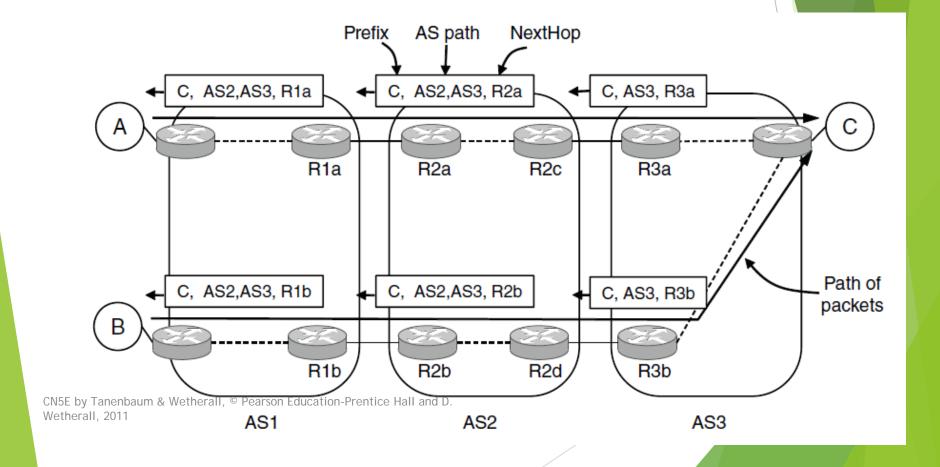

Common policy distinction is transit vs. peering:

- Transit carries traffic for pay; peers for mutual benefit
- ► AS1 carries AS2 ↔ AS4 (Transit) but not AS3 (Peer)

BGP— Exterior Routing Protocol (3)

- ▶ BGP propagates messages along policy-compliant routes
 - Message has prefix, AS path (to detect loops) and next-hop IP (to send over the local network)

Internet Multicasting

Groups have a reserved IP address range (class D)

Membership in a group handled by IGMP (Internet Group Management Protocol) that runs at routers

Routes computed by protocols such as PIM:

- Dense mode uses RPF with pruning
- Sparse mode uses core-based trees

IP multicasting is not widely used except within a single network, e.g., datacenter, cable TV network.

Mobile IP

- Mobile hosts can be reached at fixed IP via a home agent
 - Home agent tunnels packets to reach the mobile host; reply can optimize path for subsequent packets
 - No changes to routers or fixed hosts
